Press Release

Cyber Warfare Doctrine Published

The tenets for cyber warfare must be developed and integrated into a flexible framework for decision making about this new method of warfare that military leaders have called “the most significant Threat of the 21st Century.”

Lots of attention has recently been given to the threat of cyber attacks and the issue of cyber warfare. U.S. Secretary of Defense Robert Gates, and NATO Defense Ministers along with many others around the world have expressed their concerns about recent cyber attacks and the risks of cyber conflict including acts of cyber terrorism. The Cyber Warfare Doctrine is thought to be the first step required to create a meaningful dialog about exactly what constitutes an act of cyber war and what offensive and defensive cyber capabilities need to be developed as well as what international laws need to be adopted to step the proliferation of cyber weapons and cyber attacks by nation states, extremist groups, organized crime and terrorist organizations. A report by Spy-Ops suggests that as many as 120 countries already have cyber weapons development programs in place as well as an untold number of extremist groups and terrorist organizations. The summarized version of the whitepaper is published in the issue #56 of Eye Spy Intelligence Magazine that is currently available.

Eye Spy Intelligence Magazine is the world's only independent publication dedicated to espionage and intelligence. First published in May 2001, the magazine is now available in 36 countries and read by over 100,000 people worldwide. The issue is on U.S. newsstands now and includes an overview of the major points for discussion needed in order to properly frame the threat that cyber attacks and cyber warfare pose on the economy and national security.
